

RADIATION IN THE SOLAR SYSTEM THROUGH CONVERTED ELECTROSTATIC WAVES

Paul J. Kellogg

University of Minnesota, Minneapolis, MN, USA

Most electromagnetic radiation which is of interest to radio astronomy comes either from electrons rotating in magnetic fields or from conversion of the much slower electrostatic waves generated by various plasma processes. Here the concentration is on the second process, with special emphasis on the Langmuir waves generated in the foreshocks of planets and in type II and III solar bursts.

conversion, electromagnetic
